II. Overview

The focus of this senior design project, nicknamed STIMS (Smart Tagged Inventory Management System), is to create a piece of software in which mixed types of physical items can be stored and categorized through the implementation of a custom tagging system. The project will include a backend, object-oriented program dedicated to performing database tasks, as well as a graphical user interface to abstract lower-level functionality for end-user ease of use.

III. Expectations

As a team of one, I am aware of the expectations and workload of the senior design capstone. While team meetings will not be conducted in the traditional sense, I plan on providing progress updates and notes throughout the project duration on a weekly/bi-weekly basis depending on the speed of development. I also affirm my timely commitment to both 1) the various planning assignments for the CS5001 SENIOR DSGN I course as well as 2) any additional assignments or reports required by the faculty advisor of this project.
